

EMC Tutorials
Monday 31st October 2011
2:00pm - 3:45pm

EMC Tutorials are specialised workshops that devote significant time to particular areas of interest and offer best practices that attendees can implement to achieve their development and deployment initiatives.

Tutorial 1: Best Practices for EMC Documentum xCP Projects

Highlighting some best practices for planning and delivery of xCP case management projects, including defining requirements, scope to include in the first phase, Waterfall vs. Agile approach and testing.

Tutorial 2: Getting Started with EMC SourceOne File Intelligence

This tutorial focuses on using EMC SourceOne File Intelligence for gathering information about what is in the file estate. Participants will step through the process of scanning file shares, performing comprehensive analytics on the data allowing them to discern owner, last accessed, amount of storage consumed, last modified, number of duplicate files and more. Participants will then step through the process of searching this information, classifying it and taking action upon it: move (into Documentum for example), delete, tag etc.
